

Invisible fatigue creates visible consequences.

A fatigued machine operator can perform as if legally drunk — and the toll that invisible state leaves behind shows up in **hospital wards, mortuaries and insurance ledgers** across every industrial economy on earth.

01 THE VISIBLE CONSEQUENCES

WORKPLACE DEATH, INJURY & COST

3,298

Fatal Accidents

EUROPEAN UNION · PER YEAR

recorded across the EU in a single year — manufacturing is the single biggest sector for workplace accidents.

Eurostat, European Statistics on Accidents at Work, 2023.

3/day

Factory Deaths

INDIA · EVERY DAY

workers killed every day in registered factories alone — and reporting is widely incomplete.

DGFASLI, India Ministry of Labour & Employment (2017–20), via IndiaSpend.

~4,000

Accidents / yr

SRI LANKA · PER YEAR

workplace accidents reported each year; ~600,000 workdays lost — widely acknowledged to be under-reported.

ILO Country Office for Sri Lanka & the Maldives.

\$50.9_B

Comp Costs

INSURED COST · PER YEAR

direct workers'-compensation cost of the top-10 causes of serious injuries each year — "caught in running machinery" is among them.

Liberty Mutual Workplace Safety Index, 2025 (U.S.).

02 THE INVISIBLE CAUSE

FATIGUE, BEFORE THE INCIDENT

13%

of workplace injuries trace back to fatigue — and tired workers carry 1.62× the injury risk.

NSC, citing Uehli et al. (27-study review), 2014.

0.05%

17–19 hours awake degrades performance to the level of legal drunkenness; reactions up to 50% slower.

Williamson & Feyer, Occup & Environ Med, 2000.

43%

of workers admit they're sometimes too tired to work safely — highest on rotating & night shifts.

National Safety Council, Fatigue in the Workplace.

03 MAKING IT VISIBLE

CONSCIENCE IQ

Turn the invisible hazard into an early signal.

CIQ is a consent-based readiness check that flags rising fatigue **before it reaches the machine** — a leading indicator for hazard mitigation, read alongside the safety systems you already run, not after the incident report is written.

PRIVATE TO THE OPERATOR

Each person's readiness report belongs to them — never exposed to supervisors.

AGGREGATED FOR SUPERVISORS

Leaders see only an anonymised readiness score by shift, line or team — enough to rebalance a rota or call a break in time.

Sources: Eurostat ESAW 2023; DGFASLI, India Ministry of Labour & Employment (2017–20); ILO Country Office for Sri Lanka; Liberty Mutual Workplace Safety Index 2025; National Safety Council; Uehli et al. 2014; Williamson & Feyer 2000. National reporting systems differ and many are under-reported, so cross-country figures are indicative, not directly comparable. CIQ is a wellness & readiness tool, not a medical diagnosis.

ConscienceIQ

Page 1 of 2

From hidden fatigue to early action.

A short readiness check before the shift — **not an incident report after it**. Here's how Conscience IQ turns the invisible hazard into something a supervisor can act on, without ever exposing an individual.

A THE CIQ FLOW

OPERATOR READINESS

01

CHECK-IN

A human-like AI voice agent guides a short, natural conversation.

02

ASSESS

Structured, evidence-informed questions; BAT-informed scoring.

03

SENSE

With consent, at a seated check-in: response latency, voice tone, attention & recovery signals.

04

REPORT

A private readiness report: load, fatigue, recovery.

05

ACT

Aggregated readiness helps supervisors adjust rotas & recovery windows.

B WHAT CIQ MEASURES

THE HUMAN-STATE LAYER

Cognitive Load

Recovery State

Attention & Latency

Stress Response

Burnout Risk

Challenge–Skill Balance

How load, fatigue, attention and recovery shift during the readiness check-in.

C WITHOUT EXPOSING INDIVIDUALS

OPERATOR · SUPERVISOR

OPERATOR · PRIVATE

A private readiness report, owned by the operator

Personal recovery and recalibration pathways

No exposure of the personal report to supervisors

SUPERVISOR · AGGREGATED

Readiness by shift, line, team or cohort

Prioritise recovery windows, rota & workload adjustments

Act before rising fatigue becomes an incident

BAT — Burnout Assessment Tool. The voice and biometric layer is ancillary and consent-based; it adds context, not diagnosis. CIQ is a wellness & readiness tool built for **hazard mitigation** — not a medical diagnosis, a competency judgement, or surveillance.
